

The Agent Observability Divide

IntelligenzIT

Enterprise AI · Automation · Innovation

1

74% of executives achieve AI agent ROI within year one. The differentiator is not the model. It is the evaluation stack. Gartner predicts 40% of enterprise apps will embed AI agents by end of 2026. Teams that invest in evaluation tooling move nearly 6x more AI systems to production.

2

The winning stack: Full traces on every tool call and agent decision point. Not just for debugging -- for building the next eval dataset from real production behavior.

3

Repeatable evaluations scoring every trace against domain-specific criteria. Hallucination detection is table stakes. The real value is correctness, business rule adherence, and output quality scoring.

OpenTelemetry from day one. Treat agents like microservices. Observable or not deployable. Production incidents become regression tests. Edge cases become permanent guardrails.

5

Median time-to-value for agents: 5.1 months (BCG). Teams that invest in evals and observability up front cut that in half. Start with the scaffolding. The ROI follows.

Thank You
